tool. It's an awesome way to get an idea of the compatibility of your Windows 10 system with Windows 11. I'm trying to use it to upgrade my system to Windows 11 as soon as possible.

However, I'm having a hard time believing that the last major Windows

upgrade (at least for many years to come) is being released on the same day that the new Laptop screen sizes/window sizes/etc. are finalised, and is actually released to the general public. The below link is a video demonstration of the app: I don't understand why

everyone seems to have an issue with this tool, when it clearly states it will give you an idea of whether your system is compatible or not. Obviously the tool does not have the ability to give you exact details of what components are compatible and what is not, but I don't understand

how it could give the impression that it can. First of all, thanks for making a free tool available. For those having problems with the compatibility of their setup with Windows 11, it would be nice to have a list of known problems, so that the next time there is

a new version of Windows it is better prepared to handle them. Another thing that would be useful is a list of the apps that are known to not work with Windows 11, either because they aren't compatible or because they do not make full use of the new capabilities of

the OS, due to limitations of their coding. I have a Core i5 laptop with 8GB of RAM that is compatible with Windows 11, and I would like to upgrade to Windows 11 for both peace of mind and possible future upgrades. However, I have read somewhere that there

are issues with
