The API also supports Modelica. Visual LISP Visual LISP is an object-oriented programming language for AutoCAD, available since AutoCAD 1992. The current version, Visual LISP 1.0, adds XML support and adds VCL programming environments. Visual LISP has significant similarities with Visual Basic, but is compatible with virtually all the other AutoCAD applications, even ones that were not designed for the Visual Basic environment. Visual LISP was also the basis for Autodesk Exchange Apps (also referred to as simply Exchange apps). They include AddRMS and ARCCM. The AddRMS (Add Room Sheets) application supports Room Package (ARP), Room Design and Room Equipment (REQ) rooms. The ARCCM (Architectural Resource Control Modelling) application was built in collaboration with the British Columbia government and is used to control construction projects in that province. It is available for both Windows and Mac OS. One of the key features of Visual LISP was its support for independent modules which makes it a very powerful tool for the development of CAD applications and enables code reuse. Visual LISP versions are supported through the Autodesk Exchange platform, until version 4. Visual LISP is now a discontinued product, along with many of its components. Many 3D elements in AutoCAD and other Autodesk programs are built using Visual LISP for efficiency. AutoCAD Architecture supports the building blocks used for Autodesk Exchange Apps, but also provides native 3D environment. Visual LISP and VBA are very similar but are not compatible in terms of the compatibility with other AutoCAD applications. LISP supports customizable object definitions. It is the base for Autodesk Exchange Apps. LISP supports many Visual LISP functions. It is the base for Autodesk Exchange Apps.

Chang confirms the role of CRISPR/Cas9 as a genetic editing tool in bringing together the robust genetic toolbox of the cyanobacteria and the ease of use of CRISPR/Cas9. Their work is published in Nature Biotechnology. Walking through the hallways of the University of California, San Diego, most of the time, one cannot help but notice a person or two dressed in scrubs and protective gear. These “cyanobacteriologists” are a few of the many research groups conducting some of the world’s most advanced biomedical research on cyanobacteria, bacteria that inhabit water, soil, and the air around us. Editing the genome is common for many genetically modified organisms (GMOs), including agricultural crops, and has become a standard tool for researchers. CRISPR/Cas9 has been developed in bacteria to be a rapid and inexpensive way to disrupt or add genes to the bacterial genome, and is now well-established as a useful genetic tool. The tool has been used to deliver genetic materials to plant and animal cells and to edit the genome of bacteria. Last year, researchers at the University of California, San Diego, UC San Diego Pardi, San Diego, CA, and UC San Diego Bourns, La Jolla, CA, used CRISPR/Cas9 to disrupt several photosynthesis-related genes in the model cyanobacterium *Synechococcus*. A gene that controls the production of phycobilins, which are light-absorbing pigments, was deleted and the phycobilin production was found to be significantly decreased. The mutation was found to be inherited and passed on to the next generation. This was the first time a gene has been edited in a cyanobacterium,
