Shanghai Space Flight Centre The Shanghai Space flight Centre, originally called the Shanghai Institute of Aerospace Engineering, is the key strategic engineering base of the Chinese space exploration program, and the central government's key research and development base for China's future manned space programs. History The institute was established in September 1990 by the Shanghai municipal government on the basis of the Shanghai Institute of Aero-engine Research, a laboratory, which was established by the Shanghai Aviation Corporation on the site of the former Hangzhou factory. The institute originally focused on aircraft engine design, developing the C60 engine, which was a Chinese development of the Russian RD-6, and used in the Shenyang J-8. In 1994, the institute began working on a manned space exploration program, developing the Jingtangshan engine, a Chinese technology development based on the C60 engine design, which became the D-1 engine. The institute also worked on some general guidance technologies such as control systems, inertial systems and docking systems. In April 1998 the institute was established as a national program institute, and renamed the Shanghai Institute of Aerospace Engineering. In November 1999, the institute began working on a space station, as a major platform for the laboratory and the development of space related technologies, and developed the Shijian-10 space station and related technologies. On 13 April 2008 the institute was merged into the National Space Science Center.
