- Download from Link: invention relates to polymer compositions which can be used as high efficiency barrier coatings for buildings. The invention also relates to the use of such compositions for the protection of underlying building materials from moisture damage. Barrier coatings have been used to prevent moisture and water damage to building materials for hundreds of years. Although the historical uses of barrier coatings have been to protect exterior surfaces of buildings, over the years, there has been an increasing need for barrier coatings to protect interior building materials, such as roofing, walls and foundations from moisture. In addition, there has been an increasing need for barrier coatings to protect building materials from the effects of moisture and water vapor such as absorption of moisture from the environment and the transfer of moisture through a building's envelope. The need for barrier coatings has increased with the increasing building of housing, commercial, and other structures. The insulation value of building materials has been reduced, and the relative humidity of the building has increased. These changes have made the moisture damage caused by the transfer of moisture through building materials more dangerous, especially in structures having decreased insulation values. Frequently, the materials of construction of such buildings are covered with roofing systems which are designed to prevent the loss of moisture to the exterior of the building. However, such roofing systems are frequently designed to allow for the loss of moisture to the outside environment through the roofing material itself. The increased need for barrier coatings to protect the underlying building materials and reduce the transfer of moisture through the roofing system has led to the development of a wide variety of barrier coatings. Known barrier coatings include inorganic coatings and organic coatings. Inorganic coatings are often formulated to be either emulsions, solutions or water-reducible powders which can be applied to the building materials and cured. Such inorganic coatings may include for example inorganic coatings such as cement, alumina, sodium silicate, aluminosilicate, and ceramic. The use of such inorganic coatings can be expensive, environmentally unacceptable, and lead to unacceptable adherence of the coating to the building materials. Organic barrier coatings, on the other hand, are frequently formulated in aqueous dispersions which are applied to the building materials, and are generally thermoset. Such organic coatings are often referred to as "self-healing" coatings. Organic 77a5ca646e
